

# Comparing Element Towers

Stepping up from the Earth to the Metal

## Earth

## Metal

**Driver Array:** Earth is equipped with **one active 7" Torrent driver and one 7" passive**. It is a very rare design that combines a ported enclosure with a passive radiator and results in deep, accurate bass.

The flagship Metal boasts **two 7" Torrent drivers** and supplies the deepest, fastest, most impactful bass in the Totem line-up.

**Power Handling:** The Earth can handle formidable amplifiers, rated at **50-200w**.

Element Metal was designed to be paired with the most powerful audiophile amplifiers of the world. As such, it handles **50-300w**.

**Impedance:** Earth is an **8 Ohm** nominal load so while it can handle a lot of power, it **doesn't necessarily require the highest end amplifiers**. It is the perfect choice for someone wanting Element level performance yet owns good, though not great, amplification.

Metal is a **4 ohm** load and won't tolerate as vast an amplifier selection as Earth. It is a thoroughbred **and requires amplification of an equivalent level**.

**Sensitivity:** Earth is rated at 88dB. Coupled with its power handling and impedance, it can play at substantial volume levels.

Metal is rated at 91dB. It is powerful yet controlled, commanding yet mesmerizing, and capable of producing an involving performance that is true to the artist's intention.
